I would like to scrape any data sources that involve Latin America's crime rates. I would also like to scrape tweet hashtags about Hispanic deportation rates from the United States. If there was a way for me to scrape homicide locations in Mexico from online news articles I would do that. I am very new to the idea of scraping, but it is undeniably important and I'm hoping to find a way to incorporate it into future work.

6.7: df1 is a tbl_spark class and df is a tbl_df class.
6.8: They are different with df having "Sepal_Length" and df1 having "Sepal.Length" They are marginally different because they differ in class.
